Office Action Summary

Application No.

09/521,663

Applicant(s)

TAYLOR ET AL.

Examiner

Karl R. Reitz

Art Unit

2624

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 08 March 2000.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-37 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-37 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☒ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 08 March 2000 is/are: a) ☐ accepted or b) ☒ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- 11) ☐ The proposed drawing correction filed on _____ is: a) ☐ approved b) ☐ disapproved by the Examiner.
- If approved, corrected drawings are required in reply to this Office action.
- 12) ☐ The oath or declaration is objected to by the Examiner.

Priority under 35 U.S.C. §§ 119 and 120

- 13) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All b) ☐ Some * c) ☐ None of:
1. ☒ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.
- 14) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. § 119(e) (to a provisional application).
- a) ☐ The translation of the foreign language provisional application has been received.
- 15) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☒ Information Disclosure Statement(s) (PTO-1449) Paper No(s) _____
- 4) ☐ Interview Summary (PTO-413) Paper No(s). _____
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: _____

DETAILED ACTION

Specification

The following guidelines illustrate the preferred layout for the specification of a utility application. These guidelines are suggested for the applicant's use.

Arrangement of the Specification

As provided in 37 CFR 1.77(b), the specification of a utility application should include the following sections in order. Each of the lettered items should appear in upper case, without underlining or bold type, as a section heading. If no text follows the section heading, the phrase "Not Applicable" should follow the section heading:

- (a) TITLE OF THE INVENTION.
- (b) CROSS-REFERENCE TO RELATED APPLICATIONS.
- (c) STATEMENT REGARDING FEDERALLY SPONSORED RESEARCH OR DEVELOPMENT.
- (d) INCORPORATION-BY-REFERENCE OF MATERIAL SUBMITTED ON A COMPACT DISC (See 37 CFR 1.52(e)(5) and MPEP 608.05. Computer program listings (37 CFR 1.96(c)), "Sequence Listings" (37 CFR 1.821(c)), and tables having more than 50 pages of text are permitted to be submitted on compact discs.) or
REFERENCE TO A "MICROFICHE APPENDIX" (See MPEP § 608.05(a). "Microfiche Appendices" were accepted by the Office until March 1, 2001.)
- (e) BACKGROUND OF THE INVENTION.
 - (1) Field of the Invention.
 - (2) Description of Related Art including information disclosed under 37 CFR 1.97 and 1.98.
- (f) BRIEF SUMMARY OF THE INVENTION.
- (g) BRIEF DESCRIPTION OF THE SEVERAL VIEWS OF THE DRAWING(S).
- (h) DETAILED DESCRIPTION OF THE INVENTION.
- (i) CLAIM OR CLAIMS (commencing on a separate sheet).
- (j) ABSTRACT OF THE DISCLOSURE (commencing on a separate sheet).
- (k) SEQUENCE LISTING (See MPEP § 2424 and 37 CFR 1.821-1.825. A "Sequence Listing" is required on paper if the application discloses a nucleotide or amino acid sequence as defined in 37 CFR 1.821(a) and if the required "Sequence Listing" is not submitted as an electronic document on compact disc).

1. The "Background of Invention" section is missing. The "Brief Summary of the Invention" section is missing. The "Detailed Description of Invention" section is missing.

Art Unit: 2624

The "Brief Description of the Drawings" section is missing. Please follow the above guidelines.

2. The title of the invention is not descriptive. A new title is required that is clearly indicative of the invention to which the claims are directed.
3. The specification is objected to as being unclear. On page 9, line 18-20, the disclosure reads, "The resource declarations are extracted, and processing of the appropriate tasks is scheduled so that when the page to which they relate is to be printed, sufficient of the task will be completed to prevent the possibility of stall." The phrase "sufficient of the task" is unclear and perhaps missing a word.

Drawings

4. Figures 1 and 2 should be designated by a legend such as --Prior Art-- because only that which is old is illustrated (as stated on page 1 line 9, page 4 line 34 and page 5 line 1 where the drawings are referred to as conventional). See MPEP § 608.02(g). A proposed drawing correction or corrected drawings are required in reply to the Office action to avoid abandonment of the application. The objection to the drawings will not be held in abeyance.

Claim Rejections - 35 USC § 112

5. The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

6. Claim 16 is rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the enablement requirement. The claim contains subject matter, which was not

Art Unit: 2624

described in the specification in such a way as to enable one skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention.

7. Claim 16 specifies that the step of generating resource information does not include generating resource information for the first page of the job.

8. According to the detailed description of the invention, conventional PDLs and JCLs generate resource information (page 5 lines 31-33 and page 9 lines 23-26). Since claim 16 depends from claim 3 which specifies data be sent in PDL or JCL form, it is unclear how the limitations of claim 16 would be achieved. In other words, it is not described how during generation of the PDL and JCL data, the determination of the resources required for printing the first page of the document would be suppressed.

9. Claim 34 is rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the enablement requirement. The claim contains subject matter, which was not described in the specification in such a way as to enable one skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention.

10. Claim 34 specifies that the second information processing structure be adapted so as not to generate resource information for the first page of a job.

11. According to the detailed description of the invention, conventional PDLs and JCLs generate resource information (page 5 lines 31-33 and page 9 lines 23-26). Since claim 34 depends from claim 22 which specifies data be sent in PDL or JCL form, it is unclear how the limitations of claim 34 would be achieved. It is not described how,

Art Unit: 2624

during generation of the PDL and JCL data, the determination of the resources required for printing the first page of the document would be suppressed.

12. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

13. Claim 9 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

14. Claim 6 specifies that a first information processing structure carry out the step of generating the instruction data, and a second information processing structure carry out the step of generating the resource information and annotating the instruction data with the resource information.

15. Claim 9 further specifies that the second information structure be a discrete structure, which receives the instruction data as input and provides instruction data with the resource information as output.

16. Claim 9 is dependent on claim 6 and therefore must further limit the claim. Yet claim 6 already specifies the second information processing structure carry out the step of generating the resource information and annotating the instruction data with the resource information. Thus according to claim 6, the second information processing structure must take as input the instruction data (since it must annotate more information to that data) and output the resulting annotation of instruction data and resource information, which is exactly what claim 9 specifies. Thus claim 9 is unclear because one of ordinary skill in the art cannot tell if the second information structure

Art Unit: 2624

generates and/or receives the resource information. Furthermore, it is unclear if there are singular or multiple annotations of the instruction data.

17. Claim 28 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

18. Claim 23 specifies that the second information processing structure generate resource information as annotation to PDL and/or JCL. The second information processing structure is further adapted to annotate the instruction data with the resource information.

19. Claim 28 further specifies that the second information processing structure be a discrete structure receiving instruction data as input and providing instruction data annotated with resource information as output.

20. Claim 28 is dependent on claim 23 and therefore must further limit the claim. Yet claim 23 already specifies the second information processing structure carry out the step of generating the resource information and annotating the instruction data with the resource information. Thus according to claim 23, the second information processing structure must take as input the instruction data (since it must annotate more information to that data) and output the resulting annotation of instruction data and resource information, which is exactly what claim 28 specifies. Thus claim 28 fails to further limit that which is claimed in claim 23.

Claim Rejections - 35 USC § 102

21. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

22. Claims 1-4, 6, 7 and 9 are rejected under 35 U.S.C. 102(b) as being anticipated by Gerlach (5,469,532).

23. In accordance with claim 1, Gerlach discloses the practice of the printing of a job from a computer with a printer, which has a processor (col. 5 lines 3-8). Gerlach further discloses the computer generates instruction data to enable the printer to print the job (col. 8 lines 27-45 and col. 9 lines 8-13). Gerlach further discloses the computer generates information regarding the printer's required resources for printing the job (col. 8 lines 27-45). Gerlach further discloses that instruction data and resource information are sent from computer to printer (col. 8 lines 27-45 and col. 9 lines 8-13). Gerlach further discloses that the use of the printer processor's resources is scheduled for different stages of printing of the job, in accordance with the resource information (col. 8 lines 50-57 and col. 11 lines 24-25). Gerlach further discloses that the job is printed with resources used as scheduled (col. 9 lines 12-13).

24. In accordance with claim 2, Gerlach discloses that instruction data is provided in page description language (PDL) and/or job control language (JCL) (col. 9 line 67).

25. In accordance with claim 3, Gerlach discloses that resource information can be provided as an annotation to the PDL and/or JCL, in Gerlach's device resources

Art Unit: 2624

required for printing are gathered and placed into a resource store together with the RPL data (render primitives list), which are formed from PDL data (col. 10 lines 29-33). Further, after resource information is generated, the resource information is annotated to the instruction data (col. 10 lines 29-33).

26. In accordance with claim 4, Gerlach discloses that a common information processing structure carry out the steps of generating instruction data and resource information and then annotating the instruction data with the resource information (col. 10 lines 28-33). In Gerlach's system the device is called a resource assembler, it converts PDL data to RPL data and adds resources for transmission to printer (col. 10 lines 28-33).

27. In accordance with claim 6, Gerlach discloses that a first information processing structure carry out the step of generating the instruction data. In Gerlach's system, the application program performs this task by generating PDL data (col. 9 lines 66-67). Gerlach further discloses that a second information processing structure carry out the step of generating the resource information and annotating the instruction data with the resource information. In Gerlach's system, the resource assembly performs this task by gathering required resources and generating RPL data from PDL data and sending RPL data along with resources to the printer (col. 10 lines 28-33).

28. In accordance with claim 7, Gerlach discloses that the second information structure (the resource assembler; col. 10 lines 28-33) be located in an information path for instruction data from the first information processing (the application program; col. 9 line 67) structure to the printer (figure 2; where resource assembler 208 is between

Art Unit: 2624

application program 204 and printer 226). Further, since the second information processing structure takes the output of the first information processing structure as input, and the printer engine takes as input the output of the second information processing structure, it would be obvious to a person of ordinary skill in the art that the second information processing structure must lie in between the first information processing structure and the printer engine (A outputs to B, which outputs to C, therefore B must be in between A and C).

29. In accordance with claim 9, Gerlach discloses that a discrete structure, receives instruction data as input, in Gerlach's system the resource assembler receives instruction data in the form of PDL data from the application program, and outputs instruction data with resource information (col. 10 lines 28-33). In Gerlach's system instruction data in the form of RPL data is output from the resource assembler along with resources required for printing (col. 10 lines 28-33).

Claim Rejections - 35 USC § 103

30. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

31. Claims 5 and 8 are rejected under 35 U.S.C. 103(a) as being unpatentable over Gerlach in view of Snipp (5,699,495).

32. Gerlach discloses all the limitations of claim 4, from which claim 5 depends.

Gerlach further discloses that the structure that performs the operations of the common

Art Unit: 2624

information processing structure must lie in between the application program, which originally generates PDL data and the printer, to which instruction data and resource information will ultimately be sent (col. 9 line 66 – col. 10 line 33). Gerlach does not disclose expressly that the common information processing structure be the printer driver.

33. Snipp discloses that the printer driver lies between the application program and the print device (figure 2; where application program 26 connects to print device 14 through print driver 38B) to provide device driver instructions for the printer.

34. Gerlach and Snipp are combinable because they are from the same field of endeavor. At the time of invention it would have been obvious to a person of ordinary skill in the art to use the print driver of Snipp to perform the functions of the resource assembler taught by Gerlach (col. 10 lines 28-33), because it would provide a single focal point for instructions for document printing.

35. Gerlach discloses all the limitations of claim 7, from which claim 8 depends. Gerlach further discloses that the structure that performs the operations of the second information processing structure must lie in between the application program, which originally generates PDL data and the printer, to which instruction data and resource information will ultimately be sent (col. 9 line 66 – col. 10 line 33). Gerlach does not disclose expressly that the second information processing structure be the printer spooler.

Art Unit: 2624

36. Snipp discloses that the printer spooler lies between the application program and the print device (figure 2; where application program 26 connects to print device 14 through print spooler 35).

37. Gerlach and Snipp are combinable because they are from the same field of endeavor. At the time of invention it would have been obvious to a person of ordinary skill in the art to use a print spooler taught by Snipp for the resource assembler taught by Gerlach (col. 10 lines 28-33), because it would provide for more flexible and complex print scheduling.

38. Claim 10 is rejected under 35 U.S.C. 103(a) as being unpatentable over Gerlach in view of Motoyama (5,319,748).

39. Gerlach discloses all the limitations found in claim 3 from which claim 10 depends. Gerlach does not disclose expressly that the instruction data and resource information be specified in the form of comments, and that prior to sending data to the printer, the comments are filtered to extract resource information.

40. Motoyama discloses using comments to distinguish "various resources" (col. 2 line 39).

41. Gerlach and Motoyama are combinable because they are from the same field of endeavor. At the time of invention it would have been obvious to a person of ordinary skill in the art that the resource information could be placed in comments with the instruction data. The motivation of Gerlach's system is to get the resource information to the printer prior to printing, so the allocation of resources can be planned and printing is not slowed (col. 11 lines 12-15 and col. 16 lines 25-27). Since Gerlach's system is

Art Unit: 2624

communicating resource information, and it is known from Motoyama (col. 2 line 39) that resource information is provided in comments, it would be obvious to use the comments as a means of sending resource information to the printer because it would greatly simplify resource information communication.

42. Although Gerlach does not disclose filtering comments for resource information, he does disclose filtering the PDL data to determine what resources are required (col. 10 lines 29-31). Since Motoyama discloses that PDL data may contain resource information in comments it would be obvious that the combination of Gerlach's system with Motoyama's would provide filtering of comments.

43. Claims 11-15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Gerlach in view of Motoyama in further view of Siegel (5,678,133) and Motoyama (EP 0 538 059).

44. With respect to claims 11-13, Gerlach and Motoyama, do not disclose expressly where the comments are located in the PDL or JCL when they are sent to the printer.

45. Siegel discloses that "page properties" are embedded in the PDL header, which is sent to the printer (col. 6 lines 55-57). Motoyama (EP) discloses that resource information can be posted at "the beginning of each distinct document segment" (abstract lines 6-8).

46. Gerlach and Motoyama and Siegel and Motoyama (EP) are combinable because they are from the same field of endeavor. At the time of invention, it would have been obvious to a person of ordinary skill in the art to send resource information from the computer to the printer in the form of comments in the PDL, as Motoyama describes,

Art Unit: 2624

and to have the information located in a header of the PDL, as described by Siegel.

The motivation for doing so would have been to get resource information to the printer prior to transmitting data to be printed as the header gets to the printer first.

47. All the resource information can be sent in one header at the beginning of the PDL as described by Siegel (col. 6 lines 55-57) or resource information could be sent at the "beginning of each distinct document segment" as described in Motoyama (EP) (abstract lines 6-8).

48. Therefore, it would have been obvious to combine Siegel with Gerlach and Motoyama and Motoyama (EP) to obtain the invention as specified in claims 11-13.

49. Claims 14-15 are rejected as obvious for analogous reasons. Claim 14 further specifies the page headers contain resource information only for the page to which they relate or to pages later in the job if their information has not already been provided. It would be obvious to a person of ordinary skill in the art that page headers not contain information regarding pages that have already printed or that are not to be printed as this extraneous data would simply slow down the process without adding anything of value.

50. Claim 15 further specifies a method where no resource information is provided as a comment to the page header of the first page. In other words the first page is printed in the conventional manner and the remaining job is printed in the manner described above and rejected as obvious. At the time of invention, it would have been obvious to a person of ordinary skill in the art, to send data relating to the first page of the job to the printer as soon as it is ready and then continue generating resource information for the

Art Unit: 2624

remainder of the job, because doing so allows the printer to begin printing immediately instead of waiting for resource information to be generated.

51. Claim 16 is rejected under 35 U.S.C. 103(a) as being unpatentable over Gerlach in view of Motoyama in further view of Siegel and Motoyama (EP).

52. Gerlach, Motoyama, Siegel and Motoyama (EP) combine to disclose all the limitations of claim 15, from which claim 16 depends.

53. Gerlach further discloses that computer data can be translated into a bit-map data file (col. 1 lines 16-17). The data file is sent to the printer and into the print engine, which controls the printing process by handling the use of the printer's resources (col. 1 lines 20-26). Therefore, Gerlach discloses that for printing in this manner, no resource information is generated prior to the data arriving at the printer; instead the print engine handles the use of the resources.

54. Gerlach is combinable with Motoyama, Siegel and Motoyama (EP) for reasons already given above.

Claim Rejections - 35 USC § 102

55. Claims 17-19 are rejected under 35 U.S.C. 102(b) as being anticipated by Gerlach.

56. In accordance with claim 17, Gerlach discloses a printer adapted to print a job from instruction data and resource information, in Gerlach's system the Resource Executor 224, located in the printer, follows commands from instruction data and uses resources that have previously been scheduled to print a job (col. 9 lines 8-13). A printer processor, is adapted to schedule its resources for the different stages of printing

Art Unit: 2624

the job from the instruction data in accordance with the resource information; in Gerlach's system, the Resource Loader 214, performs the function of the printer processor, by determining the order in which resources will be used during the stages of printing (col. 8 lines 50-57). The job is then printed with the resources used as scheduled (col. 9 lines 10-13).

57. In accordance with claim 18, Gerlach discloses that instruction data is provided in page description language (PDL) and/or job control language (JCL) (col. 9 line 67).

58. In accordance with claim 19, Gerlach discloses that resource information can be provided as an annotation to the PDL and/or JCL, in Gerlach's device resources required for printing are gathered and placed into a resource store together with the RPL data (render primitives list), which are formed from PDL data (col. 10 lines 29-33). Further, after resource information is generated, the resource information is annotated to the instruction data (col. 10 lines 29-33).

Claim Rejections - 35 USC § 103

59. Claim 20 is rejected under 35 U.S.C. 103(a) as being unpatentable over Gerlach in view of Motoyama.

60. Gerlach discloses all the limitations found in claim 19 from which claim 20 depends. Gerlach does not disclose expressly that the instruction data and resource information be specified in the form of comments, and that the comments are filtered to extract resource information.

61. Motoyama discloses using comments to distinguish "various resources" (col. 2 line 39).

Art Unit: 2624

62. Gerlach and Motoyama are combinable because they are from the same field of endeavor. At the time of invention it would have been obvious to a person of ordinary skill in the art that the resource information could be placed in comments with the instruction data. The motivation of Gerlach's system is to get the resource information to the printer prior to printing, so the allocation of resources can be planned and printing is not slowed (col. 11 lines 12-15 and col. 16 lines 25-27). Since Gerlach's system is communicating resource information, and it is known from Motoyama (col. 2 line 39) that resource information is provided in comments, it would be obvious to use the comments as a means of sending resource information to the printer because it would greatly simplify resource information communication.

63. Although Gerlach does not disclose filtering comments for resource information, he does disclose filtering the PDL data to determine what resources are required (col. 10 lines 29-31). Since Motoyama discloses that PDL data may contain resource information in comments it would be obvious that the combination of Gerlach's system with Motoyama's would provide filtering of comments.

Claim Rejections - 35 USC § 102

64. Claims 21-24 , 26 and 28 are rejected under 35 U.S.C. 102(b) as being anticipated by Gerlach.

65. In accordance with claim 21, Gerlach discloses a computer programmed to provide a job for printing (col. 9 lines 62-66 and 11-13). The computer contains a first information processing structure to generate instruction data to enable a printer to print the job; as described above, in Gerlach's system the application program generates

Art Unit: 2624

PDL data, which is used in printing a job (col. 9 line 62 – col. 10 line 2). The computer contains a second information processing structure to generate resource information indicative of resources required by the printer at different stages of printing; as described above, in Gerlach's system, the resource assembler generates resource information for the printer (col. 10 lines 28-33). Finally, the computer contains an information path to send instruction data and resource information from the computer to the printer; in Gerlach's system information may be sent from the resource assembler to the printer (figure 2; as shown the resource assembler 208 can send data to the resource scheduler 216, which is part of the printer).

66. In accordance with claim 22 Gerlach further discloses that the first information processing structure generates instruction data as PDL and/or JCL; in Gerlach's system the application program generates PDL data (col. 9 line 67).

67. In accordance with claim 23, Gerlach discloses that the second information processing structure provides resource information as an annotation to the PDL and/or JCL; in Gerlach's device resources required for printing are gathered by the resource assembler and placed into a resource store together with the RPL (render primitives list), which is formed from the PDL data (col. 10 lines 29-33). Further, after resource information is generated, the resource information is annotated to the instruction data and together sent on to the printer (col. 10 lines 29-33).

68. In accordance with claim 24, Gerlach further discloses that the first information processing structure and the second information processing structure be combined in a common information processing structure; in Gerlach's system the resource assembler

Art Unit: 2624

takes PDL data and converts it to RPL data, which is a generation of instruction data (although instruction data has already been generated once by the application program, the resource assembler converts the PDL to RPL which is further generation of instruction data) and the resource assembler determines resource requirements of the printer, thus the resource assembler performs all the tasks defined by the first and second information processing structures and is therefore a single common information processing structure (col. 10 lines 28-33).

69. In accordance with claim 26, Gerlach discloses that the second information structure (the resource assembler; col. 10 lines 28-33) be located in an information path for instruction data from the first information processing (the application program; col. 9 line 67) structure to the printer (figure 2; where resource assembler 208 is between application program 204 and printer 226). Further, since the second information processing structure takes the output of the first information processing structure as input, and the printer engine takes as input the output of the second information processing structure, it would be obvious to a person of ordinary skill in the art that the second information processing structure must lie in between the first information processing structure and the printer engine (A outputs to B, which outputs to C, therefore B must be in between A and C). Claim 28 is rejected for the same reasons claim 26 is rejected (see Claim Rejections - 35 USC § 112 section).

Claim Rejections - 35 USC § 103

70. Claims 25 and 27 are rejected under 35 U.S.C. 103(a) as being unpatentable over Gerlach in view of Snipp.

Art Unit: 2624

71. Gerlach discloses all the limitations of claim 24, from which claim 25 depends.

Gerlach further discloses that the structure that performs the operations of the common information processing structure must lie in between the application program, which originally generates PDL data and the printer, to which instruction data and resource information will ultimately be sent (col. 9 line 66 – col. 10 line 33). Gerlach does not disclose expressly that the common information processing structure be the printer driver.

72. Snipp discloses that the printer driver lies between the application program and the print device (figure 2; where application program 26 connects to print device 14 through print driver 38B to provide device driver instructions for the printer).

73. Gerlach and Snipp are combinable because they are from the same field of endeavor. At the time of invention it would have been obvious to a person of ordinary skill in the art to use the print driver of Snipp to perform the functions of the resource assembler taught by Gerlach (col. 10 lines 28-33), because it would provide a single focal point for instructions for document printing.

74. Gerlach discloses all the limitations of claim 26, from which claim 27 depends.

Gerlach further discloses that the structure that performs the operations of the second information processing structure must lie in between the application program, which originally generates PDL data and the printer, to which instruction data and resource information will ultimately be sent (col. 9 line 66 – col. 10 line 33). Gerlach does not disclose expressly that the second information processing structure be the printer spooler.

Art Unit: 2624

75. Snipp discloses that the printer spooler lies between the application program and the print device (figure 2; where application program 26 connects to print device 14 through print spooler 35).

76. Gerlach and Snipp are combinable because they are from the same field of endeavor. At the time of invention it would have been obvious to a person of ordinary skill in the art to use a print spooler taught by Snipp for the resource assembler taught by Gerlach (col. 10 lines 28-33), because it would provide for more flexible and complex print scheduling.

77. Claim 29 is rejected under 35 U.S.C. 103(a) as being unpatentable over Gerlach in view of Motoyama.

78. Gerlach discloses all the limitations found in claim 23 from which claim 29 depends. Gerlach does not disclose expressly that the instruction data and resource information be specified in the form of comments in PDL or JCL.

79. Motoyama discloses using comments to distinguish "various resources" (col. 2 line 39).

80. Gerlach and Motoyama are combinable because they are from the same field of endeavor. At the time of invention it would have been obvious to a person of ordinary skill in the art that the resource information could be placed in comments with the instruction data. The motivation of Gerlach's system is to get the resource information to the printer prior to printing, so the allocation of resources can be planned and printing is not slowed (col. 11 lines 12-15 and col. 16 lines 25-27). Since Gerlach's system is communicating resource information, and it is known from Motoyama (col. 2 line 39)

Art Unit: 2624

that resource information is provided in comments, it would be obvious to use the comments as a means of sending resource information to the printer because it would greatly simplify resource information communication.

81. Claims 30-33 are rejected under 35 U.S.C. 103(a) as being unpatentable over Gerlach in view of Motoyama in further view of Siegel and Motoyama (EP).

82. With respect to claims 30-32, Gerlach and Motoyama, do not disclose expressly where the comments are located in the PDL or JCL when they are sent to the printer.

83. Siegel discloses that "page properties" are embedded in the PDL header, which is sent to the printer (col. 6 lines 55-57). Motoyama (EP) discloses that resource information can be posted at "the beginning of each distinct document segment" (abstract lines 6-8).

84. Gerlach and Motoyama and Siegel and Motoyama (EP) are combinable because they are from the same field of endeavor. At the time of invention, it would have been obvious to a person of ordinary skill in the art to send resource information from the computer to the printer in the form of comments in the PDL, as Motoyama describes, and to have the information located in a header of the PDL, as described by Siegel. The motivation for doing so would have been to get resource information to the printer prior to transmitting data to be printed as the header gets to the printer first.

85. All the resource information can be sent in one header at the beginning of the PDL as described by Siegel (col. 6 lines 55-57) or resource information could be sent at the "beginning of each distinct document segment" as described in Motoyama (EP) (abstract lines 6-8).

Art Unit: 2624

86. Therefore, it would have been obvious to combine Siegel with Gerlach and Motoyama and Motoyama (EP) to obtain the invention as specified in claims 30-32.

87. Claim 33 further specifies a method where no resource information is provided as a comment to the page header of the first page. In other words the first page is printed in the conventional manner and the remaining job is printed in the manner described above and rejected as obvious. At the time of invention, it would have been obvious to a person of ordinary skill in the art, to send data relating to the first page of the job to the printer as soon as it is ready and then continue generating resource information for the remainder of the job, because doing so allows the printer to begin printing instead of waiting for resource information to be generated.

88. Claim 34 is rejected under 35 U.S.C. 103(a) as being unpatentable over Gerlach in view of Motoyama in further view of Siegel and Motoyama (EP).

89. Gerlach, Motoyama, Siegel and Motoyama (EP) combine to disclose all the limitations of claim 33, from which claim 34 depends.

90. Gerlach further discloses that computer data can be translated into a bit-map data file (col. 1 lines 16-17). The data file is sent to the printer and into the print engine, which controls the printing process by handling the use of the printer's resources (col. 1 lines 20-26). Therefore, Gerlach discloses that for printing in this manner, no resource information is generated prior to the data arriving at the printer; instead the print engine handles the use of the resources.

91. Gerlach is combinable with Motoyama, Siegel and Motoyama (EP) for reasons already given above.

Claim Rejections - 35 USC § 102

92. Claim 35 is rejected under 35 U.S.C. 102(b) as being anticipated by Gerlach.

93. In accordance with claim 35, Gerlach discloses a computer system with a printer adapted to print a document from instruction data and resource information (col. 10 lines 28-33 and col. 9 lines 8-13). The printer has a processor, which is adapted to schedule its resources for the different stages of printing a job from the instruction data and resource information (col. 8 lines 63-67). Then, to print the job from the instruction data with the printer resources as scheduled (col. 9 lines 8-13). A computer is programmed to provide a job for printing. The computer has a first information processing structure to generate instruction data to enable a printer to print the job, which is the application program in Gerlach's system (col. 9 lines 66-67). It further has a second information processing structure to generate resource information indicative of resource requirements of the printer at different stages of printing the job, which is the resource assembler in Gerlach's system (col. 8 lines 39-45). The computer has an information path to send instruction data and resource information from the computer to the printer (figure 2; data can be sent from resource assembler 208 or resource loader 214 in the computer to the resource scheduler 216 or printer resource store 220 in the printer), and a communication path to carry the information from computer to printer (figure 2; data can be sent from resource assembler 208 or resource loader 214 in the computer to the resource scheduler 216 or printer resource store 220 in the printer).

Claim Rejections - 35 USC § 103

94. Claims 36 and 37 are is rejected under 35 U.S.C. 103(a) as being unpatentable over Gerlach in view of Nagata (5,696,984).

95. Claims 36 and 37 use a program storage medium having computer readable program codes to implement the method (already described above) of claims 1-3.

96. Gerlach discloses the steps of the method of claims 1-3 as described above in the rejections of claims 1-3. Gerlach does not disclose expressly the use of a program to implement the method.

97. Nagata discloses using a program to implement a method (col. 5 lines 65-67).

98. Gerlach and Nagata are combinable because they are from the same field of endeavor. Therefore, it would have been obvious to one of ordinary skill in the art to use a program to implement the method disclosed by Gerlach. The motivation for doing so would have to use the method disclosed by Gerlach to control the computer and printer system.

Contact Information

99. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Karl R. Reitz whose telephone number is (703) 305-8696. The examiner can normally be reached on Monday-Friday 8:00-4:30.

100. If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, David K. Moore can be reached on (703) 305-7452. The fax phone number for the organization where this application or proceeding is assigned is (703) 872-9306.

Art Unit: 2624

101. Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is (703) 305-9700.
